ADR: DECISION RECORDS FOR MIM REPOSITORY AND PACKAGES

CONTEXT

The MIM repository is a monorepo with multiple installable packages. Past architectural decisions are spread across issues and docs, which makes it hard to discover why key structural choices were made.

DECISION

- Store repository-level ADRs under `docs/` at the repo root.
- Require each installable package to include at least one ADR under `docs/` describing its scope and boundaries.
- Keep ADRs short, focused, and updated as decisions evolve.

CONSEQUENCES

- Cross-cutting decisions are discoverable from the root.
- Package-specific decisions stay close to their code.
- Contributors have a consistent place to record architectural changes.

STATUS

Accepted
